Window Grille

W: 108 cm; H: 112 cm

Inv. no. 528

Lathe-turned wooden window grille featuring an array of geometric patterns based on hexagons and squares, further subdivided into triangles and lozenges. The upper and lower sections employ a local wood-turning style known as mosadas (“hexagon”), while the central sections feature cross-based patterns: salib malyan (“full cross”) for squares with X-shaped centres, and salib fadi (“empty cross”) for squares with a single diagonal. In an intriguing instance of asymmetry, the sixth row from the top on the right-hand side departs from its mirrored counterpart, adopting instead a wave-like configuration known as mawg (“wave”).
